Deleting Codespace

Section 1: Deleting the GitHub Codespace

Once you have finished testing and no longer need the deployed application, it is very important to delete the Codespace. GitHub Codespaces runs on cloud infrastructure, and every active Codespace consumes compute and storage resources that count toward your billing. Even if you are not actively using Codespace, it continues to use storage for the environment and any Docker images you built inside it. Leaving a Codespace running or idle without deleting it can result in unexpected charges on your GitHub account. To avoid unnecessary costs, always delete the Codespace as soon as you are done with it.

Step 1: To understand why cleanup matters, note that GitHub Codespaces is a cloud-based development environment. As shown on the official GitHub Codespaces page (github.com/features/codespaces), it provides fully configured, secure environments hosted on GitHub's infrastructure. These environments are not free to run indefinitely, so managing their lifecycle is your responsibility.

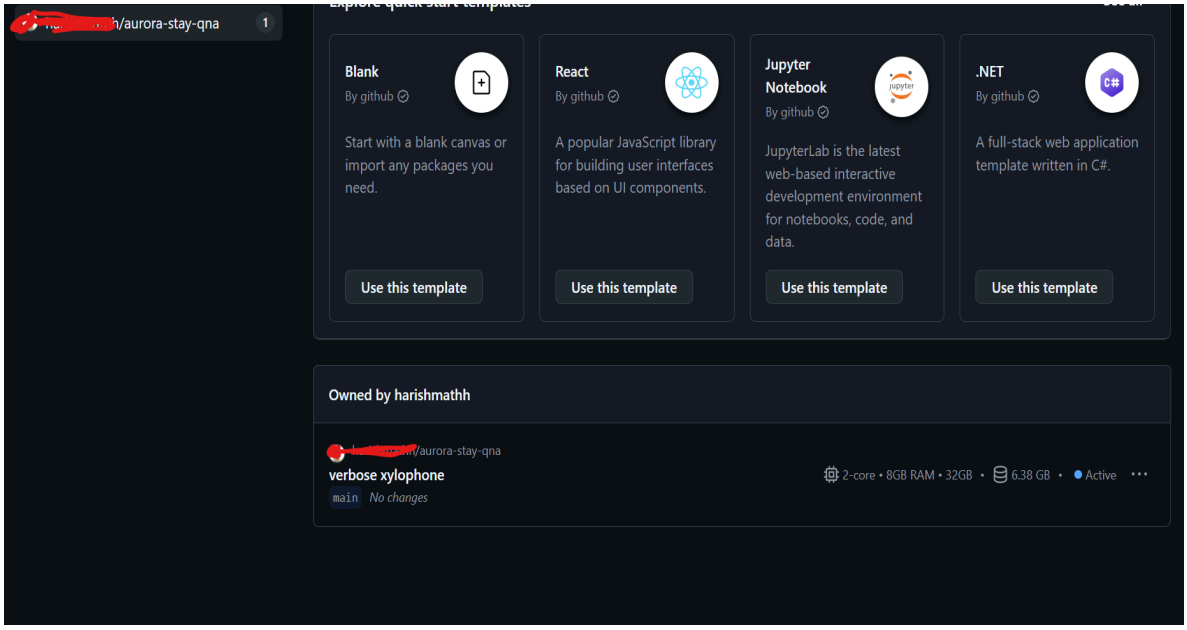

Step 2: Navigate to the Codespaces management page by going to github.com/codespaces in your browser. Under the "Owned by" section, you will see the Codespace that was created earlier for the aurora-stay-qna repository. Notice the resource details displayed next to it, such as 2-core, 8GB RAM, 32GB storage, and the current disk usage (6.38 GB in this case). The status will show as

Deleting Codespace

Active if the Codespace is still running. Click the three-dot menu icon on the right side of the Codespace entry.

Step 3: After clicking the three-dot menu, a context menu will appear with several options. You can choose Stop codespace if you want to pause it temporarily without deleting it. However, to fully clean up and stop any resource usage, scroll to the bottom of the menu and click Delete. This will permanently remove the Codespace along with all its data, Docker images, and running containers. Confirm the deletion when prompted.

Note: Stopping a Codespace only pauses the compute charges, but storage charges continue to apply. Deleting the Codespace removes everything. Always prefer deleting over stopping unless you plan to return to the same environment soon.
